

01.

Autism is a natural variation in brain development and functioning.

Autistic brains often look for facts, truth, fairness, and logic. They like to understand things clearly and may prefer routines and consistency.

02.

This looks like differences in:

- Social relating and connection
- Sensory processing (for example, how they process noise or light)
- Managing change and transitions

03.

Support needs can vary dramatically.

Support needs differ from person to person, and can also vary from day to day.

Autism is linked to:

- Genetics, brain wiring, and environment.

It is not linked to intelligence, vaccination history, or parenting style.

04.
